Decisions

- Use playtest-generated X product Big ID for store entry product ID.
- Integrate xCloud trigger into playtest publish workflow; failures won't block publish.
- Create a new offering for each playtest in xCloud.
- Prioritize PC playtests and require 'Ahmed' field; console support later.

Open questions

- Source 'Ahmed' field for PC playtests; extraction method not finalized.
- Automate PR approval for offering creation and title attachment; explore further.
- Handle cross-tenant calls during xCloud migration; implementation details unresolved.
- Cluster offerings by developer in future; scalability concerns need discussion.
- Resolve cross-tenant request issues with Corp to PME migration; solution unclear.

Agenda

- Review PlaytestImplementation.docx
 - Do we agree on the 4-step flow?
 - Do we agree on who owns what?
 - Do we agree on the payload contract model (no xProduct reads/no BigCat writes: Pass through StoreAsset Object)?
- Review PlaytestImplementation.docx (6 min)
- Agreement on 4-step flow (6 min)
- Agreement on ownership responsibilities (6 min)
- Agreement on payload contract model (7 min)
- Review PlaytestImplementation.docx (6 min)
- Agreement on 4-step flow (6 min)
- Agreement on ownership responsibilities (6 min)
- Agreement on payload contract model (7 min)

Meeting notes

- We agreed on having a checkbox for streaming option we could opt in/out
- Agreed on 1 offering id <=> 1 playtest?
- Asset id == Content id? Xcloud needs that for contract

- AumID? what is the usage around it? identifiers for folders on PC ? Can we get that from the greenbelt repo?
- Today Playtests can have no expiration date. When the Streamable option is selected we'll have to force an end date

Meeting objectives

- Brian explained that the meeting's goal was to review the PlaytestImplementation document and confirm alignment on the overall structure and plan for summer implementation.

Ownership and responsibilities

- Melanie clarified that the document outlines a four-step sequence and ownership between Playtest and xCloud, seeking confirmation from both sides on these responsibilities.

Document sharing

- Melanie mentioned sharing the PlaytestImplementation document in the chat earlier and noted that not everyone had time to review it.

Workflow and ownership

- Melanie described the four-phase end-to-end workflow for playtest creation, xCloud handoff, ingestion, and streamable launch, clarifying ownership between Playtest and xCloud.
- Anthony asked if xCloud could provide an event notification when ingestion is complete for a playtest package, and Timi confirmed this is potentially feasible.
- David raised the question of whether creating a streaming playtest should also automatically create a downloadable playtest, and the group agreed it should be an "and" scenario with a toggle option.
- The group agreed that each playtest should create a new offering, allowing for distinct customer group assignments.

Payload contract model

- Melanie presented the store asset JSON structure and discussed required fields, including content ID, for the contract between playtest and xCloud.
- The group confirmed that the store entry product ID should be the playtest-generated X product Big ID, which does not exist in Big Cat and is only meaningful for X product lookups.
- Anthony explained that the Ahmed field can be derived from the game config or package header, and if needed, ingestion may need to be updated to pull this data into the package registry.
- Timi clarified that Ahmed is only required for PC, MSI, and CC content, so its absence would not block Xbox content.

Payload contract requirements

- Timi confirmed that Ahmed is only required for PC, MSI, and CC content, and its absence would not block Xbox content.
- Timi clarified that Ahmed is currently used for telemetry during uploads and can be set to a default value for now.

Data sourcing and retrieval

- Aditya suggested that if Anthony has access to the SCID, they can retrieve the package family name and application ID from Zork, and Anthony confirmed they own Zork and can source data from there.

Blockers and open questions

- Melanie explained that two main blockers exist: a pull request is required each time an offering is created or a title is attached, and xCloud does not accept requests from Microsoft Green due to tenant migration to PME.

- Melanie confirmed that the PR blocker should be resolved soon, as Lakshmi is working on it, and noted that a migration to PME is expected by the end of summer, requiring documentation about unsupported green-to-PME requests.

Follow-up tasks

	☑ Task	👤 Assigned to	📅 Due date	🗑 Bucket
1	☐ OpenAPI spec deliverable	MC Melanie Chen	Mon, Jun 1, 2026	
2	☐ Create work items in ADO	MC Melanie Chen	Fri, May 29, 2026	
3	☐ Add Design Tradeoffs Section	MC Melanie Chen	Fri, May 29, 2026
